

ABSTRACT

A module support for forming a unitary display preferably from containers having outwardly extending access panels. In particular, a common module support for creating an array from two or more container modules is provided. The module support may be advantageously utilized as a stand alone display for floor, shelf, and/or counter placement. The module support may also be hung on a wall or column using hanging elements, e.g., double-sided adhesives, hook and loop fastening elements, and hook and/or aperture elements.
